Our Algorithm

Approximating Trees

Definition

Let G be a graph. A distance ϵ -approximating tree of G is a tree with the same vertex set as G, such that for all $u, v \in G$,

$$|d_G(u,v)-d_T(u,v)|\leq \epsilon.$$

Anders Cornect Joint work with Dr. Eduardo Martínez-Pedroza

Our Algorithm

Approximating Trees

Definition

Let G be a graph. A distance ϵ -approximating tree of G is a tree with the same vertex set as G, such that for all $u, v \in G$,

$$|d_G(u,v)-d_T(u,v)|\leq \epsilon.$$

Many problems in graph theory are trivial on trees.

Our Algorithm

Gromov's Tree

Let G be a graph on n vertices with a base point w.

Theorem (Gromov, 1987)

Any graph G can be embedded by a function φ into a weighted tree T so that:

- $d_T(\varphi(u), w) = d_G(u, w)$ for all $u \in G$,
- T is non-distance-increasing, and
- T is a $2\delta \log(n)$ -approximation of G, where δ is the Gromov hyperbolicity of G.

Combining these shows that, for all $u, v \in G$,

$$d_G(u,v) - 2\delta \log(n) \leq d_T(\varphi(u),\varphi(v)) \leq d_G(u,v).$$

Our Algorithm

Gromov's Tree

The proof of this theorem gives a general method of its construction, but with no mention of time complexity.

However, many articles cite these two works with claims that it can be done in $O(n^2)$ time. This turns out to be the case, if we start with the distance matrix D of our graph G.

000000●0	000	00	

Therefore, while this algorithm can theoretically find the distance matrix A of an approximating tree in $O(n^2)$ time, this is rarely true in practice.

$$G \xrightarrow{O(n^{\omega} \log(n))} D \xrightarrow{O(n^2)} A$$

However, we have used the particular geometry of connected graphs to bypass finding D completely.

Approximating Trees	Gromov Hyperbolicity	Our Algorithm	Conclusion
000000●0	000	00	

Therefore, while this algorithm can theoretically find the distance matrix A of an approximating tree in $O(n^2)$ time, this is rarely true in practice.

However, we have used the particular geometry of connected graphs to bypass finding D completely.

What we have done is written an explicit algorithm that results in the following theorem.

Theorem (Cornect and Martinez-Pedroza, 2023)

There is an algorithm that takes as input the adjacency matrix of a graph G on n vertices, and outputs in time $O(n^2)$ the distance matrix A of an approximating tree, as described in Gromov's Theorem.

Approximating Trees	Gromov Hyperbolicity	Our Algorithm	Conclusion

Tree-Likeness

The δ -slim triangle condition is one way of seeing δ as a measure of how "tree-like" a graph is.

Gromov's approximating tree gives another. The approximation is better for smaller δ . Small δ means a graph can be more accurately represented by a tree; it is more "tree-like".

Approximating Trees	Gromov Hyperbolicity ○○●	Our Algorithm 00	Conclusion

Tree-Likeness

The δ -slim triangle condition is one way of seeing δ as a measure of how "tree-like" a graph is.

Gromov's approximating tree gives another. The approximation is better for smaller δ . Small δ means a graph can be more accurately represented by a tree; it is more "tree-like".

Fournier et al. (2015) detailed a way of approximating δ using Gromov's approximating tree in $O(n^2)$ from D. Our algorithm allows us to do this directly from G, while staying $O(n^2)$.
